

LTI Follow-up — Power Automate Troubleshooting Guide

How to diagnose and fix a failed **LTI Follow-up Sender** flow run. For consultants and anyone supporting the workshop follow-up system.

1. What the flow does (in 20 seconds)

When an adviser submits the LTI follow-up Form, the flow rebuilds the exact `.ics` filename from the Firm + Date baked into the QR, fetches that file (and a static how-to PDF) from SharePoint, and emails them to the adviser. If any step fails, a **diagnostic email** is sent to the operator and the run is marked **Failed** (red) in run history.

```

Trigger: When a new response is submitted (Forms)
-> Get response details
-> Compose filename      {Firm}_LTI_Follow_Up_{yyyy-MM-dd}.ics
-> Try (scope)
    -> Get file content using path  ( .ics from /LTI/Generated ICS/ )
    -> Get how-to PDF              ( /LTI/Assets/LTI_Calendar_How-To.pdf )
    -> Send advisor email          ( 2 attachments )
-> Catch (scope, runs only if Try fails)
    -> Filter failed actions -> Compose error
    -> Send diagnostic email -> Terminate (Failed)
  
```

2. First response: read the failed run

1. Go to **make.powerautomate.com** → **My flows** → **LTI Follow-up Sender** → **Run history** (or open the flow inside **Solutions** if imported that way).
2. Open the most recent **Failed** (red) run.
3. The failed action is highlighted red. Click it → expand **Inputs** and **Outputs / error** to see the message.
4. Cross-check against the **diagnostic email** the run sent to the operator — it already contains the key facts:

Constructed filename	The exact <code>.ics</code> name the flow tried to fetch — compare this to the real file in SharePoint.
Firm	The Firm value from the QR (case-sensitive; may contain underscores).
Workshop date	The date value from the QR (must be <code>yyyy-MM-dd</code>).
Adviser email	Where the pack was meant to go — check for typos.
Timestamp (SGT)	When it failed (Asia/Singapore).
Error message	The raw error from the failed action.

3. Failure catalogue — symptom → cause → fix

Where it fails	Likely cause	Fix
Get file content using path (the <code>.ics</code>) — <i>most common</i>	Filename mismatch: the constructed name doesn't match any file in <code>/LTI/Generated ICS/</code> . Usually Firm capitalisation, a missing/extra underscore, or wrong date format.	Open the diagnostic email's Constructed filename and compare it letter-for-letter with the real file. Confirm the <code>.ics</code> exists in <code>/LTI/Generated ICS/</code> . Firm is case-sensitive (<code>DBS</code> $\neq$ <code>dbS</code>) and may contain <code>_</code> ; date is <code>yyyy-MM-dd</code> . Fix the QR's pre-fill values to match the filename, then have the adviser resubmit (§5).
Get how-to PDF — <i>blocks every send</i>	The static guide is missing from <code>/LTI/Assets/</code> or was renamed.	Upload <code>LTI_Calendar_How-To.pdf</code> to <code>/Capital Learning Hub/LTI/Assets/</code> with exactly that name. One-time fix; then resubmit failed runs.
Send advisor email	Invalid recipient (typo in the adviser's email), or the Outlook connection lost authorisation.	Check Adviser email in the diagnostic. If it's a typo, the adviser must resubmit with the correct address. If the error mentions <code>auth/401/403</code> , re-authenticate the Office 365 connection (§4).
Get response details	Forms connection lost authorisation, or the Form/question IDs changed.	Re-authenticate the Microsoft Forms connection (§4). If the Form was edited, confirm the question IDs still match the flow (see form-spec mapping).
Trigger never fires (no run at all)	Flow is turned Off, or the Forms trigger connection is broken.	Confirm the flow is On . Open the trigger, re-select the Form, re-authenticate Forms. Submit a test response.
Any SharePoint/Outlook action with <code>429</code> / throttled	Temporary rate limiting under high volume.	Usually transient — Resubmit the failed run (§5). If persistent, space out sends.
Wrong pack delivered (adviser got an <code>.ics</code> , but wrong firm/date)	Not a flow error — the QR had the wrong Firm/Date baked in.	Check the QR's pre-fill URL parameters; regenerate the QR from the correct filename. One unique QR per firm-per-session.

4. Connection & permission problems

The flow uses three connections. An expired or wrong-account connection is a common cause of sudden, repeated failures across many runs.

Connection	Needs	If broken
Microsoft Forms	Access to the LTI Workshop Follow-up form.	Get response details / trigger fail. Re-authenticate.
SharePoint	Read access to /Capital Learning Hub/LTI/ (both Generated ICS/ and Assets/).	Get file content actions fail. Re-authenticate; confirm the account can see the folders.
Office 365 Outlook	Sends as the connection owner. Test phase: <code>cheesin.foong@capitalgroup.com</code> .	Send email fails. Re-authenticate; confirm it's the intended sender.

To fix a connection: `make.powerautomate.com` → gear / **Connections** (or **Data** → **Connections**). Find the one with a red status → ... → **Fix connection / Reconnect** and sign in. Then resubmit the failed runs.

Sender note. During the test phase the email sends from `cheesin.foong@capitalgroup.com`. In production this becomes the Capital Learning shared mailbox (the send action changes to *Send an email from a shared mailbox (V2)*). If the sender looks wrong, check which action/connection is in use before changing anything.

5. Re-running a failed submission (so the adviser still gets their pack)

After you fix the cause, you usually don't need the adviser to scan again:

1. Open the failed run in **Run history**.
2. Click **Resubmit** (top of the run) — this replays the flow with the *same* original form submission (same adviser, Firm, date).
3. Confirm it turns green and the adviser receives the email with **two** attachments (the `.ics` + the how-to PDF).

When a resubmit will NOT help: if the failure was a wrong *value* from the QR (wrong Firm/date) or a typo in the adviser's email address, resubmitting replays the same bad data. Fix the QR / ask the adviser to submit again with the correct details instead.

6. The filename contract (root cause of most failures)

The flow and the calendar tool must agree on one filename, exactly:

```
{Firm}_LTI_Follow_Up_{yyyy-MM-dd}.ics      e.g.   DBS_LTI_Follow_Up_2026-06-30.ics
```

- **Firm** is the slugified firm name from the calendar tool — case-sensitive, and it can contain underscores (e.g. `DBS_Private_Bank`). The *generated filename is the source of truth*: copy the Firm segment verbatim into the QR, don't retype it.
- **Date** is `yyyy-MM-dd` with hyphens — `2026-06-30`, never `30-06-2026` or `2026/06/30`.

Composed by: `concat(Firm, '_LTI_Follow_Up_', WorkshopDate, '.ics')` — Firm and Date are passed through untouched, so whatever the QR baked in is exactly what gets fetched.

7. Escalation

If a run keeps failing after the fixes above, capture: the **run URL** from run history, the failed action name, the raw **error message**, and the diagnostic email. Then escalate to the flow owner (`cheesin.foong@capitalgroup.com` during the

test phase). See the full [RUNBOOK.md](#) in the project repo for step-by-step failure notes and the production-handover checklist.
